## **DETAILED ACTION**

### ***Response to Amendment***

This office action is in response to arguments filed on 09/08/03.

Applicant's arguments found not persuasive. It is the examiner responsibility to give a broadest interpretation to the language of the claim and claimed subject matter. The interpretation given to claim 1 is based on the claimed subject matter. The provided prior art considered be relevant to the submitted application. In Turatti US # 4,332,306, Fig. 5 shows, the positive supply terminal from battery 21 that are connected to the supply inputs of the control unit 111 and detector unit 110. Wherein the positive terminals of the battery 21 also connected via the control unit to the output 16a that is source of positive voltage to the coil 7. In this case the direction of the actuation will coincide with that supplied polarity of applied voltage.

Examiner maintains the rejection of claim 1 as follows.

### ***Claim Rejections - 35 USC § 102***

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Turatti US # 4,332,306.

Turatti discloses the safety system for a motor vehicle steering lock, that operates to lock the bolt in its retracted position whenever the vehicle in motion, (see abstract). Wherein, the detector device senses when the vehicle is in motion and supplies a signal to an electromagnet to effect locking. In Fig. 1 Turatti shows:

- A detector 10 having an output signal indicative of whether vehicle is moving or stationary;
- In Fig. 1, the electronic circuit 11, process the signal from the detector 10 and provides an output voltage across a pair of output lines 16a and 16b connected to the winding 7. The polarity of the output voltage from the electronic circuit 11 is such as to excite the winding 7 and consequently prevent the displacement of the bolt 5 into the extended position when the vehicle is in motion, (see column 3, lines 25-35).
- Fig. 5 shows number of control connections outputs from detector 110 to electronic circuit 111 that manage to operate the motor 7.

### ***Allowable Subject Matter***

3. Claims 2-9 based on the arguments are allowed.

### ***Conclusion***

4. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).
